Good Code:

In my good code I used Kiss, documentation, single responsibility and dry. All the functions are written as simply as possible, and are not overly complicated. I documented what everything did so that there wouldn't be confusion on what a function did. Each function has one job and responsibility and only does one thing. Lastly, there is no code repetition. Everything happens once and isn't duplicated.

Bad Code:

Violates Dry, as it repeats itself, it has YAGNI, as it has code that fixes a problem it doesn't have, it violates the documentation rule as it has no documentation of what the code does, and it's too complicated for KISS.
